

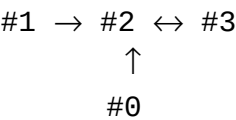

Figure 1. Recursive Core and Divergence Structure of the Constraint-Driven Divergence Model (CDDM)

Without (#0), (#1) becomes (#2), and (#3) continues without (#0).

#4 = Young child without established linguistic encoding mechanisms and limited capacity for conceptual learning

#0	Encoding Capacity
#1	Affective Input
#2	Persistent Background Signal
#3	Continuous Recursive Processing
\$1	Self-consistency
\$2	Self-validation
\$3	Termination of suffering
\$4	Internalized collapse
\$5	Constraint tension
\$6	Action activation / threshold crossing
\$7	Outward non-specific expansion
\$8	Low action-cost threshold
\$9	High action-cost threshold

Possible directional convergence patterns:

(#1 #2 #3)+\$1+\$2+\$3+\$6+(\$8+) - (\$5/\$9) → \$7

(#1 #2 #3)+\$1+\$2+\$3+\$5+\$6+(\$9+) - (\$8) → \$4
